

Answers to Test 2

①

① No. Let $f: \mathbb{C} \rightarrow \mathbb{C}$ be the function given by
 ① $f(z) = z, z \in \mathbb{C}$.

Then f is entire, but

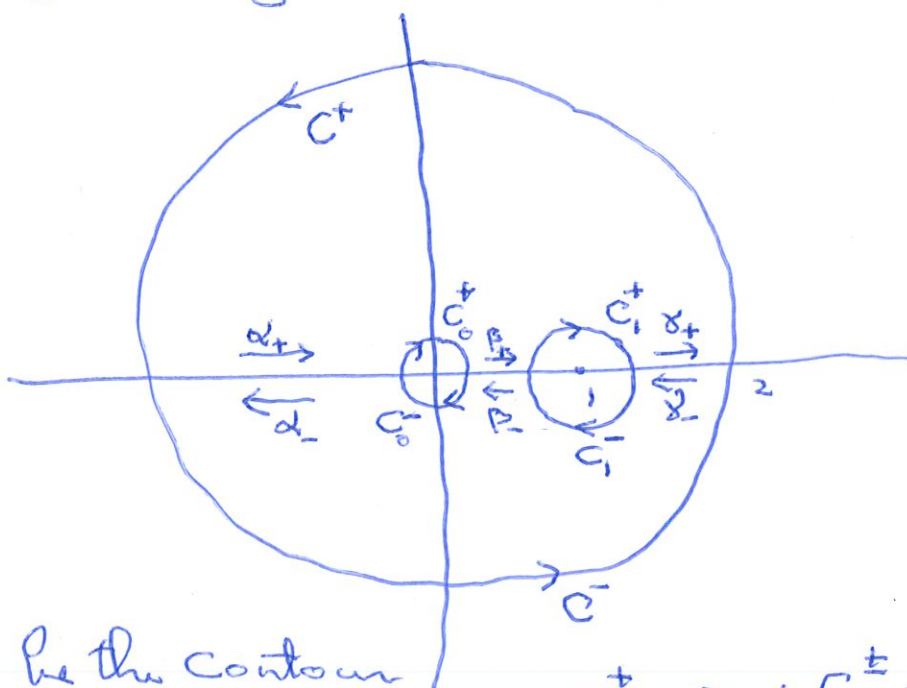

① $g(z) = f(\bar{z}) = \bar{z}, z \in \mathbb{C},$

which is nowhere holomorphic. If g has an antiderivative G , then

② $G'(z) = g(z), z \in \mathbb{C},$

showing that g is entire. This is a contradiction.

②

Let C_{\pm} be the contour
 given by $C_{\pm} = C^{\pm} + \alpha_{\pm} + C_0^{\pm} + \beta_{\pm} + C_1^{\pm} + \delta_{\pm}.$

Then by Cauchy's integral theorem,

① $\left(\int_{C^+} + \int_{-C_0} + \int_{-C_1} + \int_{C^-} \right) \left(\frac{z+1}{z^3-z^2} \right) dz = 0.$

$\int_{C_0} \frac{z+1}{z^3-z^2} dz = \int_{C_0} \frac{z+1}{z^3-z^2} dz + \int_{C_1} \frac{z+1}{z^3-z^2} dz.$

By Cauchy's Integral Formula,

(2)

$$\begin{aligned} \int_{C_0} \frac{z+1}{z^3-z^2} dz &= \int_{C_0} \frac{z+1}{z^2} dz \\ &= -2\pi i \left. \frac{d}{dz} \left(\frac{z+1}{z-1} \right) \right|_{z=0} \\ &= -2\pi i \left. \frac{(z-1) - (z+1)}{(z-1)^2} \right|_{z=0} \\ &= 4\pi i. \quad \textcircled{1} \end{aligned}$$

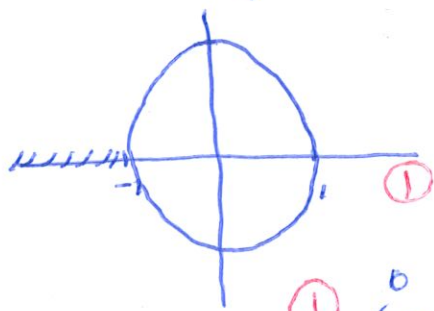

By Cauchy's Integral Formula again,

$$\int_{C_1} \frac{z+1}{z^3-z^2} dz = \int_{C_1} \frac{z+1}{z-1} dz = -4\pi i \quad \textcircled{1}$$

$$\int_C \frac{z+1}{z^3-z^2} dz = 0. \quad \textcircled{1}$$

(3) Let $f(z) = \text{Log}(1+z)$. Then f is holomorphic on $\mathbb{C} \setminus (-\infty, -1]$. $f(0) = 0$ and for all $n \in \mathbb{N}$,

$$f^{(n)}(z) = (-1)^{n+1} \frac{(n-1)!}{(1+z)^n}, \quad |z| < 1. \quad \textcircled{1}$$

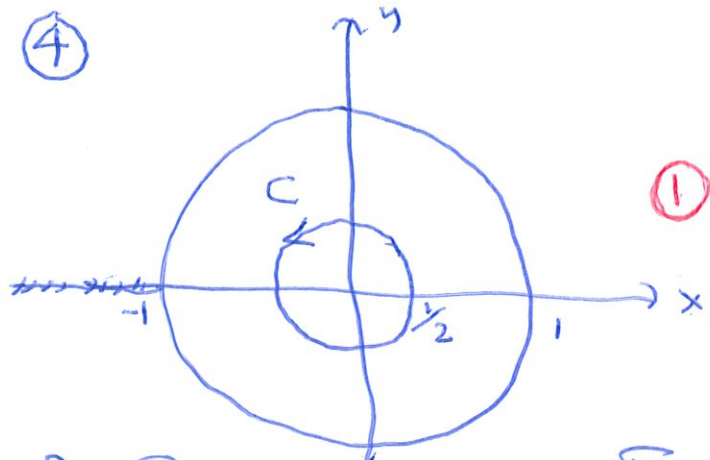

$$f^{(n)}(0) = (-1)^{n+1} \frac{(n-1)!}{1^n} \quad \textcircled{1}$$

$$\text{Log}(1+z) = \sum_{n=1}^{\infty} (-1)^{n+1} \frac{z^n}{n}. \quad \textcircled{1}$$

The largest disk of convergence for the Taylor series is $\{z \in \mathbb{C} : |z| < 1\}$. $\textcircled{1}$

④

①

$\text{Log}(1+z)$ is holomorphic ③
 on ~~some~~ a simply connected domain and C is a simple closed contour lying in the simply connected domain.

By Cauchy's Integral Formula,

$$\textcircled{2} \int_C \frac{\text{Log}(1+z)}{z^2} dz = 2\pi i \left. \frac{d}{dz} \text{Log}(1+z) \right|_{z=0}$$

$$= 2\pi i \quad \textcircled{1}$$

⑤ Let f be the holomorphic function with power series $\sum_{n=0}^{\infty} a_n z^n$. Then

$$\textcircled{1} f(z) = \sum_{h=0}^{\infty} 2^{2h} z^{2h} + \sum_{h=0}^{\infty} 3z^{2h+1}$$

$$\textcircled{1} = \sum_{h=0}^{\infty} (4z^2)^h + \left(\sum_{h=0}^{\infty} z^{2h} \right) 3z$$

$$\textcircled{1} = \frac{1}{1-4z^2} + \frac{3z}{1-z^2}, \quad |4z^2| < 1$$

i.e., $|z| < \frac{1}{2}$.

∴ the radius of convergence is $\frac{1}{2}$. ①
